

Remote Fuel Monitoring & Access Control

A Practical Application

AKCess Pro Door Control Unit

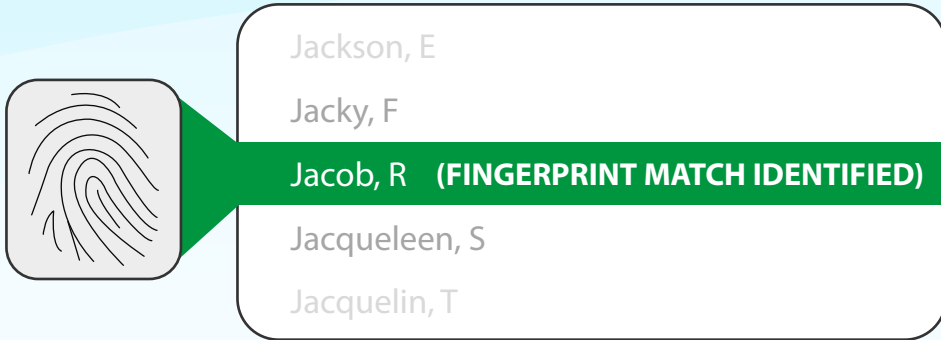

The Door Control Unit works in parallel with your existing environmental monitoring solutions from AKCP.

Existing clients and customers who already have Remote Environmental Monitoring for their Fuel Stations or Remote Telecom Sites can easily add AKCP's Access system.

- Easily installed using plug and play connections.
- Trigger recording actions on Sensor Events then email or send via MMS as a picture record.
- Integrates with environmental monitoring with unlimited expansion.
- No need to integrate third party applications or hardware.

Stage One : Fingerprint Capture

Once captured, a Fingerprint is mapped and key points of interest are stored in a "Template" file.

The database of users is then queried to find the owner of the Fingerprint.

Once verified, a record of the user is kept in both the local storage of the Door Control Unit and transmitted securely to the AKCess Pro Server.

Fingerprint Verified. CCTV Cameras Enabled. Fuel Pump Valve Released.

Stage Two : Video Recording & Notifications

Sensor Notifications can be used to automate corrective action or to turn equipment on or off. In this instance, the fuel pump is activated by the use of a 12V Relay. Thus allowing the User access to the Fuel.

Once the Fingerprint has been verified, Cameras can be used to record the Event in Real Time. Footage can be stored locally on the Door Control Unit, on the AKCess Pro Server Application - or on **both**.

When using an EDGE-180 Modem use the "Heartbeat" feature to "Push" Sensor and Picture Log information at predefined intervals.

If an open connection can be established all of the time, the Door Control Unit has a built in "Secure openVPN" feature which can connect seamlessly to AKCess Pro Server.

This modem is ideal for remote locations where a Door Control Unit is being used to monitor and control access to critical resources. Once connected to the Door Control Unit you can use the usual notification and alerting functions to:

Send SMS, MMS and Voice call alerts instantly from the Door Control Unit.

Connect wirelessly to the AKCess Pro Server Application

Accelerated Rate of Change

The Ultrasonic Fuel Level Sensor comes equipped with advanced rate of change detection that measures the level rate in a percentage from 1% to 50% over a period of time from 1 to 20 minutes.

You can set the direction to Up, Down, or Both and you can set the Status when the limit is exceeded to show either High Critical or Low Critical.

*Cameras Recording, Sensor & Image Information Stored
EDGE / GPRS / GSM Link to AKCess Pro Server Established*

Stage Three : AKAccess Pro Server

With every verified Fingerprint, a timestamped Access Log is kept that records each request for Fuel.

If a User does not have the necessary permissions to access the Fuel Pump, this is registered with the System, showing the Users Name, along with where and when they tried to Access the Pump. *See Figure 1.*

All user information is held both locally on the Door Control Unit and on the AKAccess Pro Server. Once synchronized, the Door Control Unit works independently of the Server until which point the User chooses to synchronize the unit's with the Server Database.

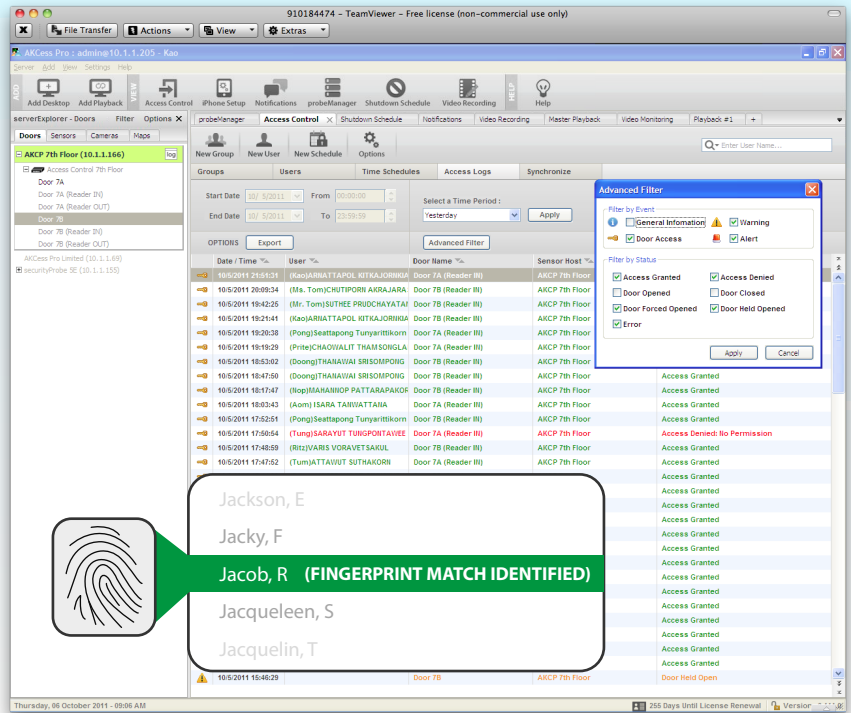

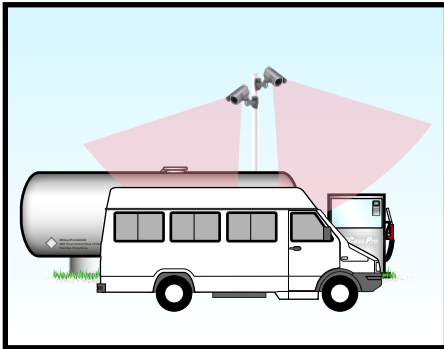

Figure 1 - Detailed Access Reports show, the User Name along with Where and When the user tried to access the pumping station.

Recorded Footage of Theft, Leaks and Over-Use

Recording Events are dynamically linked to Sensor Events.

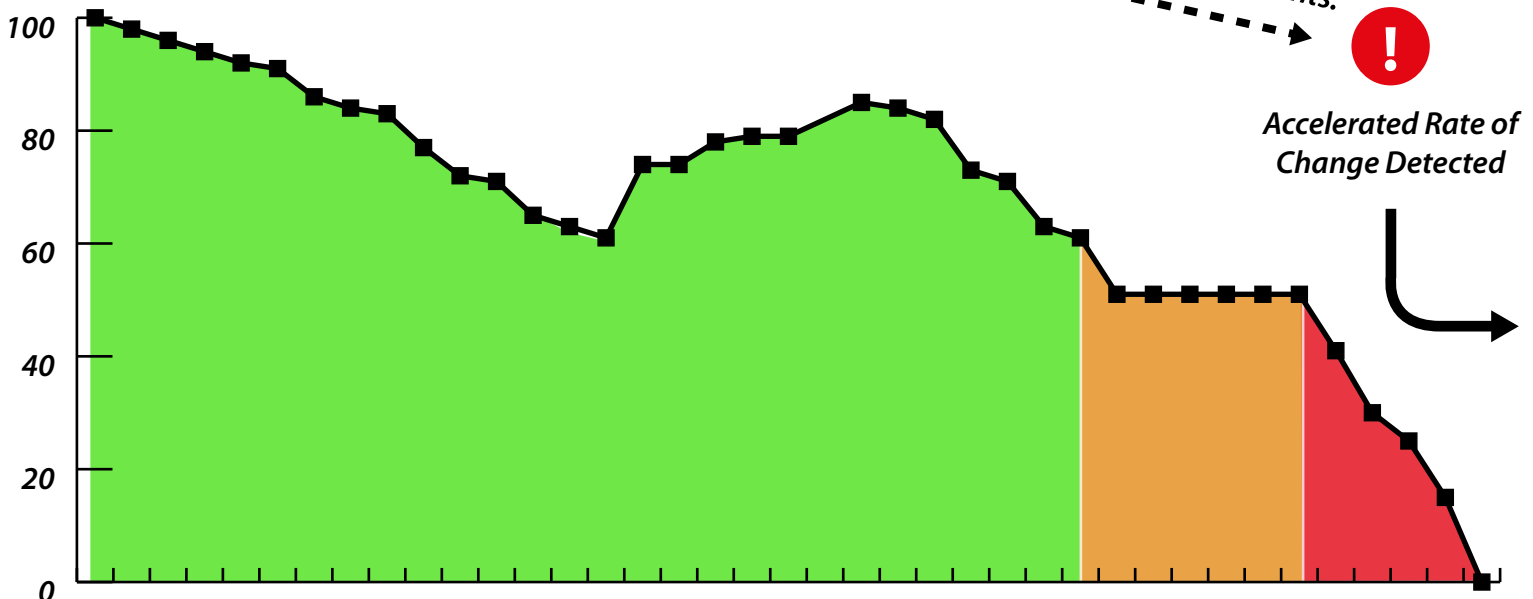

Figure 2 - Integrated RRD Graphing eliminates the need for 3rd Party Graphing Utilities. View Multiple Graphs across Multiple Sites.

Stage Three : AKCess Pro Server

What's more, with AKCess Pro Server you can drag & drop your doors, sensors, cameras and access control readers - all of your monitoring devices, onto any map of your choice.

Monitor an overview, or drill down to a specific device location. Maps showing cities, countries, buildings, and specific rooms are easily combined as a visual representation with a host of preset animations to use.

Sensors are dragged into the Map and displayed by Region.

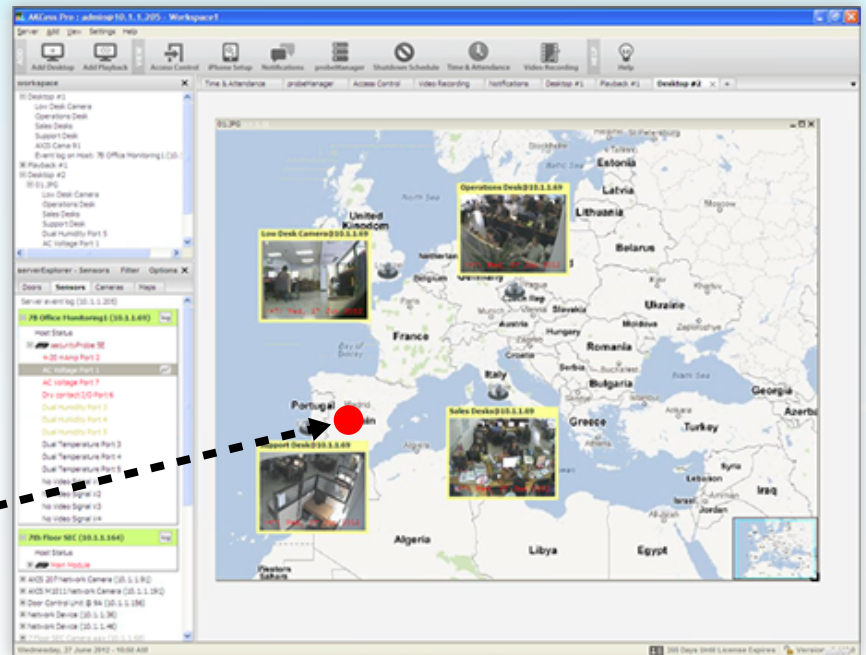

Figure 3 - AKCess Pro Servers : Mapping lets you visualize all of your remote sites on a single map or 'drill down' to show local site information.

Integration with over 2000+ ONVIF Compatible IP Cameras

AKCess Pro Server supports over 2000 compatible ONVIF IP Cameras. What's more, you can add and configure IP Cameras directly from the AKCess Pro Server Interface. Using AKCP's newly developed scanning algorithm, you can find and start using ONVIF Compliant IP Camera's located on your network instantly.

Figure 4 - The AKCP iPhone Application allows you to view Sensor, Camera and Playback information from any Base Unit connected to your AKCess Pro Server Installation.

Add Additional Sensors...

It's easy to integrate with existing solutions or add additional High Definition digital cameras, environmental sensors, siren strobe alarms, smoke detectors, power monitors, and relay switches to existing local or remote sites.

Sales Information
